

Hello World Flutter App

Flutter 3.47.5 (with Dart 3.13.4), Java 17, and the Android SDK were installed on an Apple Silicon Mac under ~/development/flutter-toolchain. The Flutter and Android tool paths were added to ~/.zprofile, and the Android SDK and Java locations were configured with flutter config. The setup was checked with flutter doctor, which confirmed that Flutter and the Android toolchain were ready. An Android 15 (API 35) ARM64 system image was installed, and a Pixel 6 emulator named Ass3_Pixel was created.

The Android project was created with flutter create --platforms=android --org com.example --project-name hello_world hello_world. The starter code in lib/main.dart was replaced with a simple screen containing an app bar and a centered "Hello World" message. After running flutter pub get, the app was built and launched on the emulator with flutter run -d emulator-5554. Portrait and landscape screenshots were captured directly from the running emulator. The submitted project contains the single Dart app file, its dependency files, and the Android files needed to build and run it.
